AssetWORKS

Go Asset Management

Mobility is Life

Go Asset Management provides real-time, secure access to asset data so that users can create and update asset information in the field such as replacement parts, photos, and notes. Easily perform location verification, meter readings, and inspections directly from an iOS device while on the go in the field.

Solve Problems

Assets are the foundation of your organization, and incomplete or imprecise asset profiles, hierarchies, and ownership make work management difficult or inexact. When your team is in the field, unknown or inaccurate lists of asset replacement parts lead to multiple trips and wasted time. Managing your massive asset inventory is no small task and Go Asset Management improves efficiencies with capturing, collecting and managing information as well as reducing the paperwork and time related to location and asset inspection.

A Unique Approach

- Direct access to the asset profile via the purpose built mobile application allows users to create and update asset information in the field in real-time.

Key Benefits

- Connectivity directly into your AiM system improves real-time data capture.
- Reduce paperwork and improve accuracy
- Improve operational efficiencies

- Update the replacement parts list for an asset using an iOS device for accurate quantities and part numbers.

- Integrated barcode scanning allows users to perform quick and accurate asset inventories.

- Inspection functionality helps users to quickly and easily inspect locations or assets. Users can then enter a rating, link photographs, and log remedial actions from their IOS device.
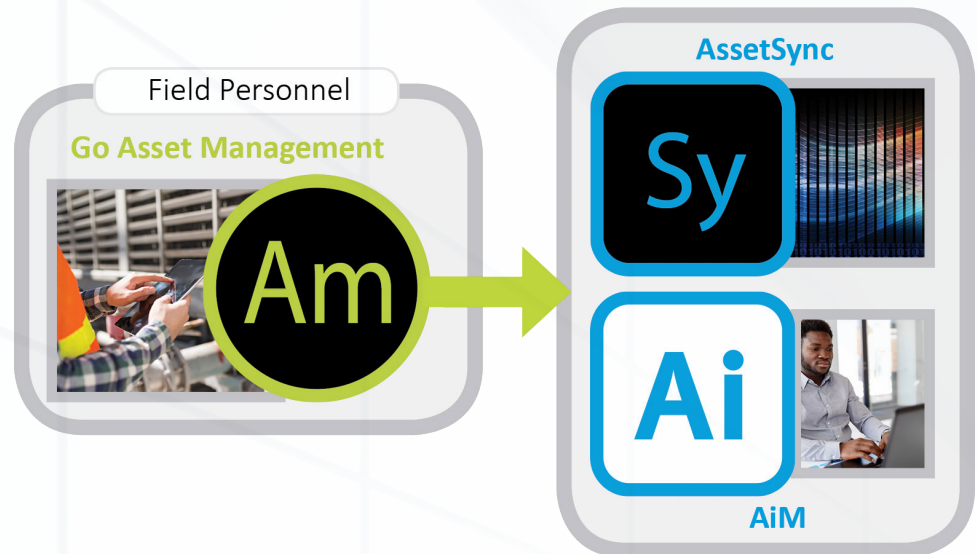

Go Asset Management

How It Works

A versatile mobile application, Go Asset Management integrates with the core of AiM enabling Maintenance Field Technicians to capture asset details, add parts to an asset, verify asset location and inspect assets directly in the field from an iOS device. In conjunction with AssetSync the asset data can pass immediately to your organization's Asset Manager for final approval and prior to syncing with AiM. Optionally, Go AM works with AiM Energy Management to capture field meter readings or ANA to assess an asset's status and needs.
